Al-SiC brake disc.

The material

Metal matrix composites are metals reinforced with ceramic particles. The most widely used are based on aluminum reinforced with particles of silicon carbide or alumina. The reinforcement increases the stiffness, strength and maximum service temperature without seriously increasing the weight. Production now exceeds 10,000 tonnes per year, at a cost of 2 - 5 £/kg.

Environmental notes

The production of MMCs is energy intensive, but not otherwise damaging. Those based on aluminum can be made from part-recycled material, and the product itself can, in principle, be recycled.

Supporting information

Design guidelines

The attraction of metal matrix composites such as Duralcan is their stiffness-to-weight and strength-to-weight ratios, allowing weight saving in automobiles and sports equipment.

Technical notes

Metal matrix composites ('MMCs') are made by stirring finely divided silicon carbide (SiC) or alumina (Al2O3) particles into the molten metal, which is then cast ('Stir-casting'), or by mixing metal and ceramic powders and sintering, followed by forging or extrusion. The most widely used are the DURALCAN range of alloys based on the 6061 grade of aluminum alloy, with 10 to 30% silicon carbide or alumina.

Typical uses

Pistons, engine parts, brake discs, drums and calipers, drive shafts, precision instruments and sports equipment such as mountain bike frames and golf club shafts.
