

## Description

### Image

### Caption

Super light luggage with magnesium sheet faces and extruded edging.

### The material

Magnesium is a metal almost indistinguishable from aluminum in color, but of lower density. It is the lightest of the light-metal trio (with partners aluminum and titanium) and light it is: a computer case made from magnesium is barely two thirds as heavy as one made from aluminum. It, aluminum and magnesium are the mainstays of airframe engineering. Only beryllium is lighter, but its expense and potential toxicity limit its use to special applications only. Magnesium is flammable, but this is only a problem when it is in the form of powder or very thin sheet. It costs more than aluminum but nothing like as much as titanium. Magnesium and its alloys have a hexagonal crystal structure (unlike aluminum) restricting their ability to be rolled or forged at room temperature. They can however be extruded, forged and rolled above 350 C. This partly accounts for the low consumption of wrought products -- they account for about 25% of Mg alloy consumption.

### Composition (summary)

Mg+alloying elements, e.g. Al, Mn, Si, Zn, Cu, Li, rare earth elements

## General properties

Density	93.6	-	122	lb/ft <sup>3</sup>
Price	* 1.22	-	1.32	USD/lb
Date first used	1950			

## Mechanical properties

Young's modulus	6.09	-	6.82	10 <sup>6</sup> psi
Shear modulus	2.32	-	2.76	10 <sup>6</sup> psi
Bulk modulus	5.08	-	5.95	10 <sup>6</sup> psi
Poisson's ratio	0.29	-	0.31	
Yield strength (elastic limit)	16.7	-	59.5	ksi
Tensile strength	26.8	-	65.3	ksi
Compressive strength	16.7	-	59.5	ksi

Elongation	3.5	-	18	% strain
Hardness - Vickers	43	-	135	HV
Fatigue strength at 10 <sup>7</sup> cycles	* 13.1	-	32.6	ksi
Fracture toughness	* 10.9	-	16.4	ksi.in <sup>0.5</sup>
Mechanical loss coefficient (tan delta)	9e-4	-	0.02	

### Thermal properties

Melting point	836	-	1.2e3	°F
Maximum service temperature	248	-	392	°F
Minimum service temperature	-118	-	-63.7	°F
Thermal conductor or insulator?	Good conductor			
Thermal conductivity	28.9	-	72.8	BTU.ft/h.ft <sup>2</sup> .F
Specific heat capacity	0.228	-	0.253	BTU/lb.°F
Thermal expansion coefficient	13.7	-	15.6	µstrain/°F

### Electrical properties

Electrical conductor or insulator?	Good conductor			
Electrical resistivity	4.15	-	15	µohm.cm

### Optical properties

Transparency	Opaque			
--------------	--------	--	--	--

### Critical Materials Risk

High critical material risk?	Yes			
------------------------------	-----	--	--	--

### Processability

Castability	4	-	5	
Formability	2	-	3	
Machinability	5			
Weldability	4			
Solder/brazability	2	-	3	

### Durability: water and aqueous solutions

Water (fresh)	Excellent			
Water (salt)	Limited use			
Soils, acidic (peat)	Limited use			
Soils, alkaline (clay)	Limited use			
Wine	Limited use			

### Durability: acids

Acetic acid (10%)	Limited use			
Acetic acid (glacial)	Unacceptable			

Citric acid (10%)	Limited use
Hydrochloric acid (10%)	Unacceptable
Hydrochloric acid (36%)	Unacceptable
Hydrofluoric acid (40%)	Acceptable
Nitric acid (10%)	Unacceptable
Nitric acid (70%)	Unacceptable
Phosphoric acid (10%)	Unacceptable
Phosphoric acid (85%)	Unacceptable
Sulfuric acid (10%)	Unacceptable
Sulfuric acid (70%)	Unacceptable

### **Durability: alkalis**

Sodium hydroxide (10%)	Acceptable
Sodium hydroxide (60%)	Acceptable

### **Durability: fuels, oils and solvents**

Amyl acetate	Excellent
Benzene	Excellent
Carbon tetrachloride	Excellent
Chloroform	Excellent
Crude oil	Limited use
Diesel oil	Excellent
Lubricating oil	Excellent
Paraffin oil (kerosene)	Excellent
Petrol (gasoline)	Excellent
Silicone fluids	Excellent
Toluene	Excellent
Turpentine	Excellent
Vegetable oils (general)	Excellent
White spirit	Excellent

### **Durability: alcohols, aldehydes, ketones**

Acetaldehyde	Excellent
Acetone	Excellent
Ethyl alcohol (ethanol)	Excellent
Ethylene glycol	Excellent
Formaldehyde (40%)	Excellent
Glycerol	Excellent
Methyl alcohol (methanol)	Excellent

### **Durability: halogens and gases**

Chlorine gas (dry)	Limited use
Fluorine (gas)	Acceptable
O2 (oxygen gas)	Unacceptable
Sulfur dioxide (gas)	Excellent

### Durability: built environments

Industrial atmosphere	Acceptable
Rural atmosphere	Excellent
Marine atmosphere	Limited use
UV radiation (sunlight)	Excellent

### Durability: flammability

Flammability	Non-flammable
--------------	---------------

### Durability: thermal environments

Tolerance to cryogenic temperatures	Unacceptable
Tolerance up to 150 C (302 F)	Acceptable
Tolerance up to 250 C (482 F)	Unacceptable
Tolerance up to 450 C (842 F)	Unacceptable
Tolerance up to 850 C (1562 F)	Unacceptable
Tolerance above 850 C (1562 F)	Unacceptable

### Geo-economic data for principal component

Annual world production, principal component	5.61e5	ton/yr
Reserves, principal component	2.36e15 - 2.5e15	l. ton

### Primary material production: energy, CO2 and water

Embodied energy, primary production	* 3.19e4	-	3.51e4	kcal/lb
CO2 footprint, primary production	* 33.6	-	37.1	lb/lb
Water usage	* 112	-	123	gal(US)/lb
Eco-indicator 99	790			millipoints/kg

### Material processing: energy

Extrusion, foil rolling energy	* 1.27e3	-	1.4e3	kcal/lb
Rough rolling, forging energy	* 649	-	717	kcal/lb
Wire drawing energy	* 4.67e3	-	5.16e3	kcal/lb
Metal powder forming energy	* 2.17e3	-	2.62e3	kcal/lb
Vaporization energy	* 1.57e6	-	1.73e6	kcal/lb
Coarse machining energy (per unit wt removed)	* 144	-	159	kcal/lb
Fine machining energy (per unit wt removed)	* 978	-	1.08e3	kcal/lb
Grinding energy (per unit wt removed)	* 1.91e3	-	2.1e3	kcal/lb
Non-conventional machining energy (per unit wt removed)				

1.57e4 - 1.73e4 kcal/lb

### Material processing: CO2 footprint

Extrusion, foil rolling CO2	* 0.877	-	0.97	lb/lb
Rough rolling, forging CO2	* 0.449	-	0.497	lb/lb
Wire drawing CO2	* 3.23	-	3.57	lb/lb
Metal powder forming CO2	* 1.6	-	1.94	lb/lb
Vaporization CO2	* 1.08e3	-	1.2e3	lb/lb
Coarse machining CO2 (per unit wt removed)	* 0.0998	-	0.11	lb/lb
Fine machining CO2 (per unit wt removed)	* 0.678	-	0.749	lb/lb
Grinding CO2 (per unit wt removed)	* 1.32	-	1.46	lb/lb
Non-conventional machining CO2 (per unit wt removed)	10.8	-	12	lb/lb

### Material recycling: energy, CO2 and recycle fraction

Recycle	✓			
Embodied energy, recycling	* 4.89e3	-	5.4e3	kcal/lb
CO2 footprint, recycling	* 3.54	-	3.92	lb/lb
Recycle fraction in current supply	9.2	-	11.4	%
Downcycle	✓			
Combust for energy recovery	✗			
Landfill	✓			
Biodegrade	✗			
Toxicity rating	Non-toxic			
A renewable resource?	✗			

### Environmental notes

Magnesium is the fifth most abundant metal in the Earth's crust, and the third in its oceans - and it can be extracted economically from both (the Dead Sea, thick with dissolved salts - is the best source of all). But its extraction is very energy intensive, consuming three times more per unit weight than commodity polymers and nearly twice as much as aluminum. It can be recycled, and doing this uses barely one fifth as much energy.

## Supporting information

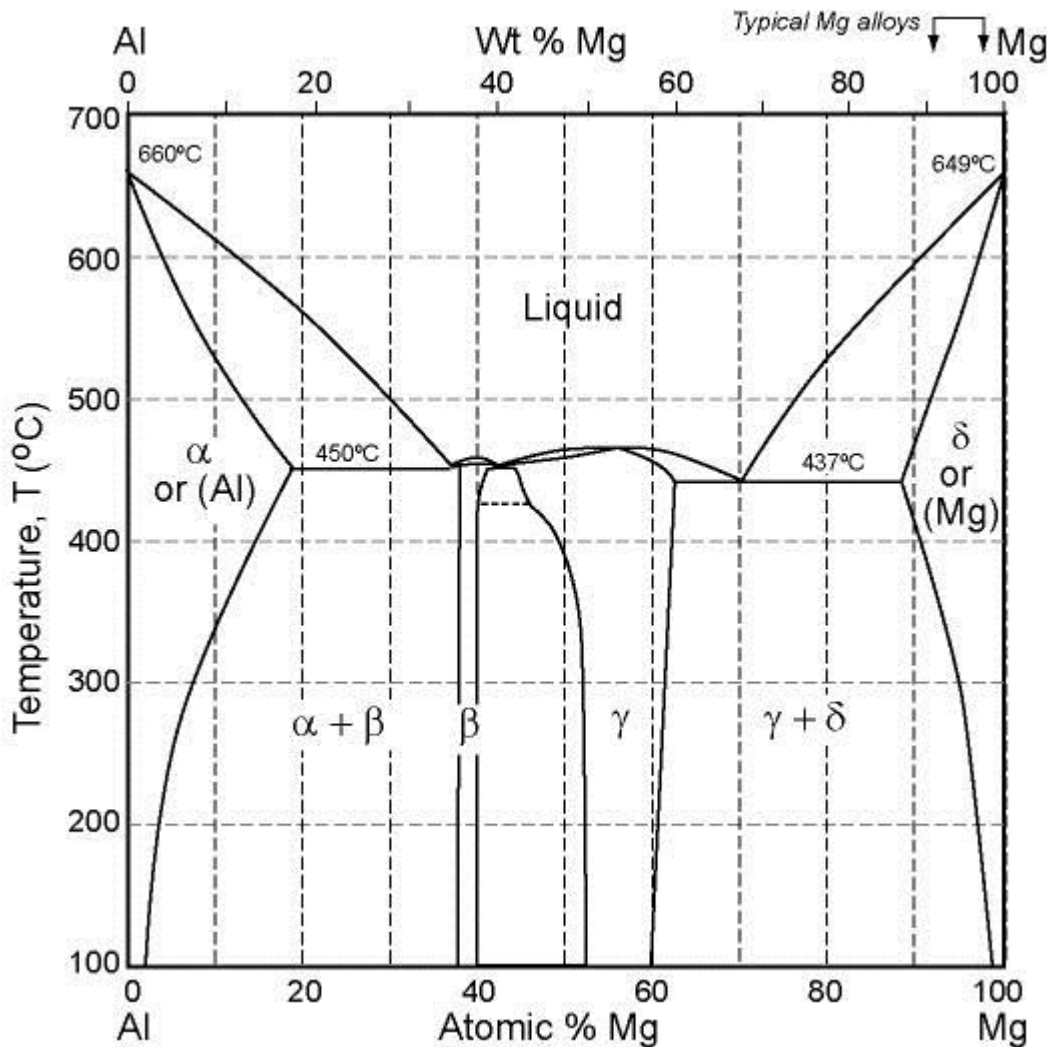

### Design guidelines

Magnesium has a low density, good mechanical damping, much better thermal conductivity than steel, less good electrical conductivity than copper and aluminum, but still good. It survives well in the protected environment of a house or office, but it corrodes badly in salt water and acids; even sweat is enough to tarnish it, requiring coatings for protection. It is easy to machine, but because of its low stiffness, parts must be firmly clamped while doing so. Magnesium alloys are designed for specific forming purposes: AZ31B, for instance, is designed for extrusions. Most magnesium alloys can be welded using TIG or MIG methods; and soldering and adhesive bonding are both feasible. Spot and seam welds are possible but only in low stress applications; riveting is better, provided aluminum rivets are used to avoid galvanic corrosion.

### Technical notes

The classification system of the American Society for Testing Materials (ASTM) is the most widely used. In this system, the first two letters indicate the principal alloying elements, thus: A = aluminum, C = copper, E = rare earths, K = zirconium, L = lithium, M = manganese, S = silicon, Z = zinc. The letter corresponding to the element present in the greatest quantity is used first; if they are equal, they are listed alphabetically. The letters are followed by numbers that list the amount of the principal alloying elements in weight % rounded to the nearest whole number; thus AZ91 means the alloy 90% Mg, 9% Al and 1% Zn; LA141 means the alloy 85% Mg, 14% Li and 1% Al.

### Phase diagram

### Phase diagram description

Wrought magnesium alloys are based on alloys of magnesium (Mg) with 3 - 8% aluminum (Al), some with additions of zinc, manganese or copper. This is the magnesium - aluminum phase diagram.

### Typical uses

Aerospace, automotive, sports goods such as bicycles, nuclear fuel cans, vibration damping and shielding of machine tools, engine case castings, crank cases, transmission housings, automotive wheels, ladders, housings for electronic equipment, particularly mobile phone and portable computer chassis, camera bodies, office equipment, marine hardware and lawnmowers.

### Tradenames

Electron, Dowmetal, Revere alloy, Eclipsalloy
