#### The material

Tungsten is remarkable for its melting point of 3410 °C when pure. This is a problem if you want to process it, but an attraction if you want to use it at high temperatures. Processing is solved by using powder methods -- the same methods used to shape refractory ceramics. Its high melting point gives tungsten excellent creep resistance up to 1400 °C (the temperature listed below as the maximum service temperature), but if not under load it can be used at much higher temperatures: photoflood bulbs reach 2200 °C, though they have a short life.

#### **Composition (summary)**

> 99% W

## **General properties**

| Density         | 1.11e3 | - | 1.22e3 | lb/ft^3 |
|-----------------|--------|---|--------|---------|
| Price           | * 29.5 | - | 34.4   | USD/lb  |
| Date first used | 1783   |   |        |         |

### **Mechanical properties**

| Young's modulus                 | 45     | - | 55.1 | 10^6 psi |
|---------------------------------|--------|---|------|----------|
| Shear modulus                   | 17.4   | - | 21.5 | 10^6 psi |
| Bulk modulus                    | 32.5   | - | 42.9 | 10^6 psi |
| Poisson's ratio                 | 0.27   | - | 0.29 |          |
| Yield strength (elastic limit)  | 76.1   | - | 116  | ksi      |
| Tensile strength                | 104    | - | 435  | ksi      |
| Compressive strength            | 80.5   | - | 116  | ksi      |
| Elongation                      | 1      | - | 17   | % strain |

### **Critical Materials Risk**

| High critical material risk? | Yes |
|------------------------------|-----|
|------------------------------|-----|

## **Processability**

| Castability        | 1 |     |
|--------------------|---|-----|
| Formability        | 1 | - 2 |
| Machinability      | 1 | - 2 |
| Weldability        | 3 | - 4 |
| Solder/brazability | 1 | - 2 |

## **Durability: water and aqueous solutions**

| Water (fresh)          | Excellent  |
|------------------------|------------|
| Water (salt)           | Acceptable |
| Soils, acidic (peat)   | Excellent  |
| Soils, alkaline (clay) | Excellent  |
| Wine                   | Acceptable |

## **Durability: acids**

| Acetic acid (10%)       | Acceptable  |
|-------------------------|-------------|
| Acetic acid (glacial)   | Acceptable  |
| Citric acid (10%)       | Acceptable  |
| Hydrochloric acid (10%) | Acceptable  |
| Hydrochloric acid (36%) | Limited use |
|                         |             |

| Hydrofluoric acid (40%) | Unacceptable |
|-------------------------|--------------|
| Nitric acid (10%)       | Limited use  |
| Nitric acid (70%)       | Limited use  |
| Phosphoric acid (10%)   | Limited use  |
| Phosphoric acid (85%)   | Limited use  |
| Sulfuric acid (10%)     | Unacceptable |
| Sulfuric acid (70%)     | Unacceptable |

# **Durability: alkalis**

| Sodium hydroxide (10%) | Acceptable |
|------------------------|------------|
| Sodium hydroxide (60%) | Acceptable |

## **Durability: fuels, oils and solvents**

| Amyl acetate             | Excellent  |
|--------------------------|------------|
| Benzene                  | Excellent  |
| Carbon tetrachloride     | Excellent  |
| Chloroform               | Excellent  |
| Crude oil                | Acceptable |
| Diesel oil               | Excellent  |
| Lubricating oil          | Excellent  |
| Paraffin oil (kerosene)  | Excellent  |
| Petrol (gasoline)        | Excellent  |
| Silicone fluids          | Excellent  |
| Toluene                  | Excellent  |
| Turpentine               | Excellent  |
| Vegetable oils (general) | Excellent  |
| White spirit             | Excellent  |
|                          |            |

# Durability: alcohols, aldehydes, ketones

| Acetaldehyde              | Excellent |

#### **Environmental notes**

Tungsten is a skin and eye irritant and is noxious if ingested.

### **Supporting information**

#### Design guidelines

Tungsten is heavy, relatively expensive and difficult to process -- it is a choice of last-resort. Most of its applications exploit its very high melting point (spark plug electrodes and lamp filament), its exceptional tensile strength when drawn to wire (reinforcement in metal, ceramic and polymer-matrix composites) or it very high density (armour-piercing penetrators). Because of the difficulty of processing tungsten it is generally available only as wire, rod or sheet.

#### Technical notes

Tungsten is produced by a chemical route that delivers the metal as a fine powder. The powder is pressed into billets, sintered and swaged to rod, then drawn to wire or rolled to sheet. Wires as fine as 5 microns in diameter are available. They can be woven into fabric or used as reinforcement in other metals, ceramics or polymers.

#### Typical uses

Applications are of four types.

- 1. Those using the high-temperature capability of tungsten: spark-plug electrodes, lamp filaments, heating elements and furnace windings and electrodes for TIG welding.
- 2. Those using the high density: balance weights, anti-vibration tooling, armour-piercing penetrators and radiation shielding, and X and gamma-ray shielding
- 3. Those using the high strength: reinforcement in composites, surface coatings for abrasion resistance
- 4. Those using its ability to harden steel: tool steels and armor.
