#### The material

Tungsten carbide (WC) is most commonly used in the form of a 'cemented' carbide, or cermet: particles of WC held by a small amount (5-20%) of metallic binder, usually cobalt. Its exceptional hardness and stability make it an attractive material when wear resistance is essential. Properties depend on grain size and shape and the proportion of carbide to metal. Cermets are expensive but, as cutting tools, they survive cutting speeds 10 times those of the best tool steel. Shaping is usually done by pressing, sintering and then grinding; the tool bit is brazed to a shank or blade made from a cheaper steel. Cermets can be vapor-coated with titanium nitride to improve wear resistance even further.

#### Compositional summary

WC/ 2 - 10%Co

| A renewable resource?              | ×         |
|                                    |           |

#### **Environmental notes**

Preparing tungsten carbide products is energy intensive, and cobalt is a comparatively rare element, regarded as strategic because of its unique properties. For this reason, tungsten carbide is, where possible, recycled.

### **Tungsten carbides**

#### Design guidelines

Tungsten carbide (WC) and cermets - which are 80 to 95% WC - can only be shaped by slitting with diamond tools and by grinding, liming the shapes to which they can economically be formed. They are used only where needed: the tips (but not the shanks) of cutting tools for drilling, sawing, rock cutting. Only diamond-tipped tools are more wear resistant. Technical ceramics are formed by the following steps.(a) Pressing, isostatic pressing, powder extrusion (for bars and tubes) or powder injection molding (for intricate, high-volume parts).(b) Green-machining in the unfired state, using standard tools.(c) Firing or "sintering" typically at 1550 - 1700 C for 12 to 20 hours; the part shrinks by about 20%.(d) Diamond grinding to achieve tighter tolerance and surface finish: +/- 10 microns is achievable. The cost of a ceramic part is greatly increased if it has to be diamond-ground. Thus design for net-shape sintering, eliminating step (d) is highly desirable. The standard tolerance for as-fired dimensions is +/- 1% or 125 microns, whichever is greater.

#### Technical notes

Tungsten carbide starts as a powder, is pressed with up to 10% of cobalt to the desired shape, then fired at a high temperature under pressure, causing the cobalt to melt and bond the powder particles together.

#### Typical uses

Cutting tool tips; abrasives; cermets, oil-drilling and stone-cutting equipment, dental
