#### The material

Papyrus, the forerunner of paper, was made from the flower stem of the reed, native to Egypt; it has been known and used for over 5000 years. Paper, by contrast, is a Chinese invention (105 AD). It is made from pulped cellulose fibers derived from wood, cotton or flax. There are many different types of paper and paper board: tissue paper - newsprint, kraft paper for packaging, office paper, fine glazed writing paper, cardboard - and a correspondingly wide range of properties. The data below span the range of newsprint and kraft paper.

### Composition (summary)

Cellulose fibers, usually with filler and

### **General properties**

### **Critical Materials Risk**

| High critical material risk? | No |
|------------------------------|----|

# **Processability**

## **Durability: water and aqueous solutions**

| Water (fresh)          | Unacceptable |
|------------------------|--------------|
| Water (salt)           | Unacceptable |
| Soils, acidic (peat)   | Unacceptable |
| Soils, alkaline (clay) | Unacceptable |
| Wine                   | Acceptable   |

# **Durability: acids**

| Acetic acid (10%)       | Unacceptable |
|-------------------------|--------------|
| Acetic acid (glacial)   | Unacceptable |
| Citric acid (10%)       | Unacceptable |
| Hydrochloric acid (10%) | Unacceptable |
| Hydrochloric acid (36%) | Unacceptable |
| Hydrofluoric acid (40%) | Unacceptable |

# Paper and cardboard

| Nitric acid (10%)     | Unacceptable |
|-----------------------|--------------|
| Nitric acid (70%)     | Unacceptable |
| Phosphoric acid (10%) | Unacceptable |
| Phosphoric acid (85%) | Unacceptable |
| Sulfuric acid (10%)   | Unacceptable |
| Sulfuric acid (70%)   | Unacceptable |

# **Durability: alkalis**

| Sodium hydroxide (10%) | Unacceptable |
|------------------------|--------------|
| Sodium hydroxide (60%) | Unacceptable |

# **Durability: fuels, oils and solvents**

| Amyl acetate             | Acceptable  |
|--------------------------|-------------|
| Benzene                  | Acceptable  |
| Carbon tetrachloride     | Acceptable  |
| Chloroform               | Acceptable  |
| Crude oil                | Limited use |
| Diesel oil               | Acceptable  |
| Lubricating oil          | Acceptable  |
| Paraffin oil (kerosene)  | Acceptable  |
| Petrol (gasoline)        | Acceptable  |
| Silicone fluids          | Acceptable  |
| Toluene                  | Acceptable  |
| Turpentine               | Excellent   |
| Vegetable oils (general) | Acceptable  |
| White spirit             | Acceptable  |

# Durability: alcohols, aldehydes, ketones

| Acetaldehyde              | Acceptable |
|---------------------------|------------|
| Acetone                   | Acceptable |
| Ethyl alcohol (ethanol)   | Acceptable |
| Ethylene glycol           | Acceptable |
| Formaldehyde (40%)        | Acceptable |
| Glycerol                  | Acceptable |
| Methyl alcohol (methanol) | Acceptable |

# **Durability: halogens and gases**

| Chlorine gas (dry)   | Limited use  |
|----------------------|--------------|
| Fluorine (gas)       | Unacceptable |
| O2 (oxygen gas)      | Unacceptable |
| Sulfur dioxide (gas) | Limited use  |

## Paper and cardboard

| <b>Durability:</b> | built | environments |
|--------------------|-------|--------------|
|--------------------|-------|--------------|

| Industrial atmosphere   | Unacceptable |
|-------------------------|--------------|
| Rural atmosphere        | Unacceptable |
| Marine atmosphere       | Unacceptable |
| UV radiation (sunlight) | Fair         |

## **Durability: flammability**

| Flammability | Highly flammable |
|--------------|------------------|
|--------------|------------------|

## **Durability: thermal environments**

| Tolerance to cryogenic temperatures | Acceptable   |
|-------------------------------------|--------------|
| Tolerance up to 150 C (302 F)       | Acceptable   |
| Tolerance up to 250 C (482 F)       | Unacceptable |
| Tolerance up to 450 C (842 F)       | Unacceptable |
| Tolerance up to 850 C (1562 F)      | Unacceptable |
| Tolerance above 850 C (1562 F)      | Unacceptable |

## Geo-economic data for principal component

# Primary material production: energy, CO2 and water

| Embodied energy, primary production | * 48.9   | - | 54     | MJ/kg          |
|-------------------------------------|----------|---|--------|----------------|
| CO2 footprint, primary production   | * 1.11   | - | 1.23   | kg/kg          |
| Water usage                         | * 1.62e3 | - | 1.79e3 | l/kg           |
| Eco-indicator 95                    | 95.5     |   |        | millipoints/kg |
| Eco-indicator 99                    | 110      |   |        | millipoints/kg |

# Material recycling: energy, CO2 and recycle fraction

| Recycle                            | <b>√</b>            |
|------------------------------------|---------------------|
| Embodied energy, recycling         | * 21 - 23.2 MJ/kg   |
| CO2 footprint, recycling           | * 1.13 - 1.25 kg/kg |
| Recycle fraction in current supply | 70 - 74 %           |
| Downcycle                          | ✓                   |
| Combust for energy recovery        | ✓                   |
| Heat of combustion (net)           | * 19.2 - 20.2 MJ/kg |
| Combustion CO2                     | * 1.07 - 1.13 kg/kg |
| Landfill                           | ✓                   |
| Biodegrade                         | ✓                   |
| Toxicity rating                    | Non-toxic           |
| A renewable resource?              | ✓                   |

### **Supporting information**

#### **Technical notes**

Paper is graded in "grammage", the weight, in grams, per unit area. typically 40 - 120 g/m^2. The "bulk" of paper is the reciprocal of its density. The typical sheet "caliper" or thickness of newsprint is 40 - 50 microns; that of bond paper 60 - 90 microns, paper board 120 - 300 microns. "Book bulk" is the number of sheets that, when stacked, have a thickness of 25 mm (1 inch). For newsprint this is 60 - 80, for office paper, it is 105 - 110.

Cellulose fibers (the main constituent of paper) swell in diameter by 15 - 20% from dry to water-saturated. Since most of the fibers in paper lie parallel, change of humidity can change the dimension of the sheet, affecting registration in printing, which therefore requires a controlled atmosphere. Typically moisture accounts of 6 - 9 % of the weight of paper. Friction, too, is important in printing and in packaging; the coefficient of friction of paper sliding on paper is 0.35 - 0.45

### Typical uses

Packaging, filtering, writing, printing, currency, electrical and thermal insulation, gaskets.
