

#### **Description**

#### **Image**

#### Caption

Polyurethane foam used for

#### The material

Polymer foams are made by the controlled expansion and solidification of a liquid or melt through a blowing agent; physical, chemical or mechanical blowing agents are possible. The resulting cellular material has a lower density, stiffness and strength than the parent material, by an amount that depends on its relative density - the volume-fraction of solid in the foam. Flexible foams can be soft and compliant, the material of cushions, mattresses, and padded clothing. Most are made from polyurethane, although latex (natural rubber) and most other elastomers can be foamed.

#### **Composition (summary)**

Hydrocarbon

#### **General properties**

## **Durability: flammability**

## **Durability: thermal environments**

Tolerance to cryogenic temperatures	Unacceptable
Tolerance up to 150 C (302 F)	Acceptable
Tolerance up to 250 C (482 F)	Unacceptable
Tolerance up to 450 C (842 F)	Unacceptable
Tolerance up to 850 C (1562 F)	Unacceptable
Tolerance above 850 C (1562 F)	Unacceptable

# Primary material production: energy, CO2 and water

Embodied energy, primary production	* 103	-	114	MJ/kg
CO2 footprint, primary production	* 4.28	-	4.73	kg/kg
Water usage	* 216	-	239	l/kg
Eco-indicator 95	480			millipoints/kg
Eco-indicator 99	386			millipoints/kg

## **Material processing: energy**

Polymer extrusion energy	* 5.39	-	5.94	MJ/kg
Polymer molding energy	* 13.7	-	15.1	MJ/kg
Coarse machining energy (per unit wt removed)	* 0.48	-	0.53	MJ/kg
Fine machining energy (per unit wt removed)	* 0.522	-	0.577	MJ/kg
Grinding energy (per unit wt removed)	* 0.57	-	0.629	MJ/kg

## **Material processing: CO2 footprint**

Polymer extrusion CO2	* 0.431	-	0.476	kg/kg
Polymer molding CO2	* 1.09	-	1.21	kg/kg
Coarse machining CO2 (per unit wt removed)	* 0.036	-	0.0398	kg/kg
Fine machining CO2 (per unit wt removed)	* 0.0392	-	0.0433	kg/kg

Grinding CO2 (per unit wt removed)

\* 0.0427 - 0.0472 kg/kg

#### Material recycling: energy, CO2 and recycle fraction

Recycle	×
Embodied energy, recycling	* 47.1 - 52 MJ/kg
CO2 footprint, recycling	* 3.7 - 4.09 kg/kg
Recycle fraction in current supply	8.02 - 8.86 %
Downcycle	✓
Combust for energy recovery	✓
Heat of combustion (net)	* 44 - 46.2 MJ/kg
Combustion CO2	* 3.06 - 3.22 kg/kg
Landfill	✓
Biodegrade	×
Toxicity rating	Non-toxic
A renewable resource?	×

#### **Environmental notes**

Foaming of insulation with CFCs has a damaging effect on the ozone layer - it is now abandoned. Monomers and foaming agents pose hazards; good practice overcomes these. For cushioning, the requirements are comfort and long life; polyurethane foams have been commonly used, but concerns about flammability and durability limit their use in furniture.

#### **Supporting information**

#### Design guidelines

Flexible foams have characteristics that suit them for cushioning and packaging of delicate objects. They are shaped by injecting or pouring a mix of polymer, catalyst and foaming agent into a mold where the agent evolves gas, expanding the foam. Expanding in a cold mold gives a solid surface skin. Closed cell foams float in water; open cell foams absorb liquids and act as sponges.

#### **Technical notes**

The properties of foams depend, most directly, on the material of which they are made and on the relative density (the fraction of the foam that is solid). Most commercial foams have a relative density between 1% and 30%. To a lesser extent, the properties depend on the size and the shape of the cells. Low density, closed cell, foams have exceptional low thermal conductivity. Skinned rigid foams have good bending stiffness and strength of low

#### Typical uses

Packaging, buoyancy, cushioning, sleeping mats, soft furnishings, artificial skin, sponges, carriers for inks and
